Topic presentation, October 2026

1 The question and the track

Replace. One paragraph. The question in one sentence, and the track: **Track A** — you relax an assumption of a course paper and re-derive the proposition it affects; or **Track B** — you formulate the economic model behind your own thesis.

2 The baseline and the assumption you change

Replace. Track A: cite the paper, the exact proposition and page, and state the assumption you relax, in the paper’s notation. Track B: state the model your thesis currently lacks or cites as a black box. Write the agent’s problem formally — what is maximised, over which variable, under which constraints.

3 The result you expect

Replace. Write the first-order condition you expect to obtain, and say which result of the baseline you expect to change and in which direction. This is a conjecture: it is graded on being precise, not on being right.

$$\frac{\partial}{\partial e} \left[ae - \frac{c}{2}e^2 \right] = a - ce = 0. \quad (1)$$

4 Why this is not already solved

Replace. Where you looked: the paper’s appendices, its working-paper versions, and the papers that cite it. Say what you found and why it does not answer your question. “The model did not find it” is not evidence.

5 Plan and risks

Replace. What you will prove, what you will simulate, and what you will formalize in Lean. Name the step most likely to fail and what you will do if it does.
