Replace. The question, and your result in one sentence — with its condition.

Replace. Primitives, timing, and the agent's problem.

$$\max_{e \geq 0} ae - \frac{c}{2} e^2, \quad a > 0, c > 0$$

Replace. The proposition as it is stated in the paper.

Proposition 1. If $a > 0$ and $c > 0$, the unique solution is $e^* = a/c$, and $\partial e^* / \partial a = 1/c > 0$.

Replace. The idea of the proof, the step that was hard, and what is still open today.
This is a progress report: say where you are.

5 · Simulations

Replace. What the script checks,
on which parameter range, and
what a simulation cannot show.

In the paper. $a > 0, c > 0 \implies e^* = a/c$.

In Lean (replace with your own statement and proof fragment):

```
theorem prop_effort (a c : ℝ) (ha : 0 < a) (hc : 0 < c) :
  a / c ∈ Set.Ici (0 : ℝ) ∧
  IsMaxOn (fun e => a * e - c / 2 * e ^ 2) (Set.Ici 0) (a / c)
```

Replace. How the objects and assumptions are represented, whether Lean verifies the paper's claim exactly or under an added hypothesis, and the result of the check.

Replace. One claim of the model, your verdict with its reason, and the hand derivation on screen.

Replace. The two or three questions on which you want the class's critique before writing the final version.
